

How to order the Tucson Adjustable Bottom Bar (TABB)

We are using the term "long rail" so as not to get confused with the high side of the patio which would be the shorter rail. So, we need 2 things (1) the long rail side (looking at the hood), & (2) the difference between the 2 rails, (slope offset) for example 1", 1.5" etc. The adjustable arm will allow 1.5" of offset which comes standard with .75" felt. With 1" felt you can achieve a 2.5" slope correction. The bottom bar/arm assembly will come with the arm fixed to the bottom bar with tape so it will not be moving during transport or install. After the bottom bar is placed into the Solution rail during installation the holding tape can be removed. To check for proper alignment of the 2 pieces, push the compressed side of the arm up into the bottom bar. If the arm does not retract up, move the arm a slight amount to the opposite side & try again.
